

WORKSTATION MANAGEMENT TOOL

ABSTRACT

Employee workstations are managed throughout their entire lifecycle from initial planning to final disposal using an integrated software tool and method. A customer account manager application is used to define financial relationships of the owners of the workstations. Coupled thereto is a workstation planning and deployment manager application which is used to define capital plans for workstations for the owners. A client information manager application coupled to the workstation planning and deployment manager application maintains information about the owners and is adapted to accept entry of deployment information of workstation to owners. An asset information manager application maintains capital asset information such as serial number, location, and book value for the workstations. The asset information manager application receives updates from the client information manager application and provides input to the workstation planning and deployment manager application.
